

Firms in Competitive Markets

WHAT IS A COMPETITIVE MARKET?

- A *competitive market* has many buyers and sellers trading identical products so that each buyer and seller is a price taker.
 - Buyers and sellers must accept the price determined by the market.

The Meaning of Competition

- A perfectly competitive market has the following characteristics:
 - There are many buyers and sellers in the market.
 - The goods offered by the various sellers are largely the same.
 - Firms can freely enter or exit the market.

The Meaning of Competition

- As a result of its characteristics, the perfectly competitive market has the following outcomes:
 - The actions of any single buyer or seller in the market have a negligible impact on the market price.
 - Each buyer and seller takes the market price as given.

- Total revenue for a firm is the selling price times the quantity sold.
- $TR = (P \times Q)$
- Total revenue is proportional to the amount of output.

- Average revenue tells us how much revenue a firm receives for the typical unit sold.
- Average revenue is total revenue divided by the quantity sold.

• In perfect competition, average revenue equals the price of the good.

Average Revenue =
$$\frac{\text{Total revenue}}{\text{Quantity}}$$

$$= \frac{\text{Price} \times \text{Quantity}}{\text{Quantity}}$$

- *Marginal revenue* is the change in total revenue from an additional unit sold.
- $MR = \Delta TR/\Delta Q$
- For competitive firms, marginal revenue equals the price of the good.

Table 1 Total, Average, and Marginal Revenue for a

Competitive Firm

Quantity (Q)	Price (P)	Total Revenue $(TR = P \times Q)$	Average Revenue (AR = TR/Q)	Marginal Revenue $(MR = \Delta TR/\Delta Q)$
1 gallon	\$6	\$ 6	\$6	
2	6	12	6	\$6 6
3	6	18	6	O
4	6	24	6	6
5	6	30	6	6
6	6	36	6	
7	6	42	6	6
8	6	48	6	6

PROFIT MAXIMIZATION AND THE COMPETITIVE FIRM'S SUPPLY CURVE

- The goal of a competitive firm is to maximize profit.
- This means that the firm will want to produce the quantity that maximizes the *difference* between total revenue and total cost.

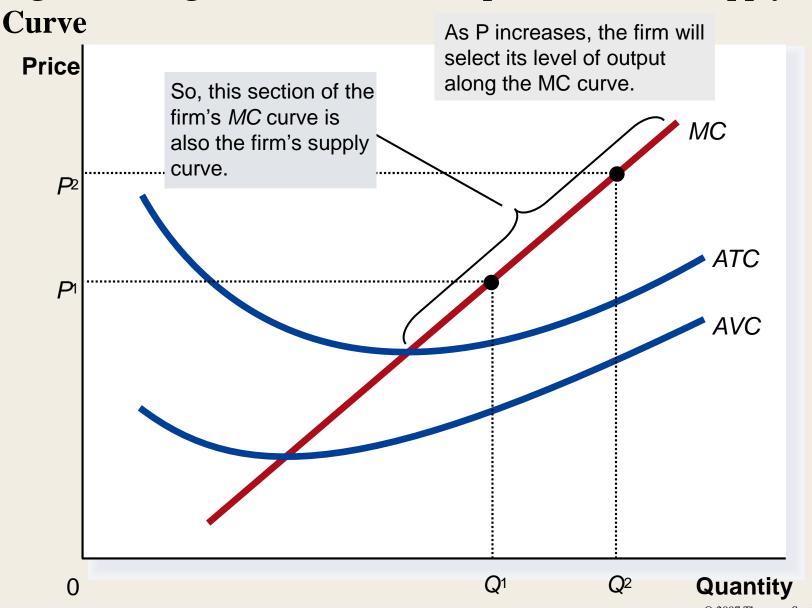

Table 2 Profit Maximization: A Numerical Example

Quantity (Q)	Total Revenue (TR)	Total Cost (TC)	Profit (TR – TC)	Marginal Revenue $(MR = \Delta TR/\Delta Q)$	Marginal Cost $(MC = \Delta TC/\Delta Q)$	Change in Profit (<i>MR</i> – <i>MC</i>)
0 gallons	\$ 0	\$ 3	- \$3	Φ.	40	
1	6	5	1	\$6	\$2	\$4
2	12	8	4	6	3	3
3	18	12	6	6	4	2
				6	5	1
4	24	17	7	6	6	0
5	30	23	7	6	7	– 1
6	36	30	6	6	8	– 2
7	42	38	4			
8	48	47	1	6	9	- 3

The Marginal Cost-Curve and the Firm's Supply Decision

- Profit maximization occurs at the quantity where *marginal revenue equals marginal cost*.
 - When MR > MC, increase Q
 - When MR < MC, decrease Q
 - When MR = MC, profit is maximized.
 - *Under perfect competition, P=MR=AR*

Figure 2 Marginal Cost as the Competitive Firm's Supply

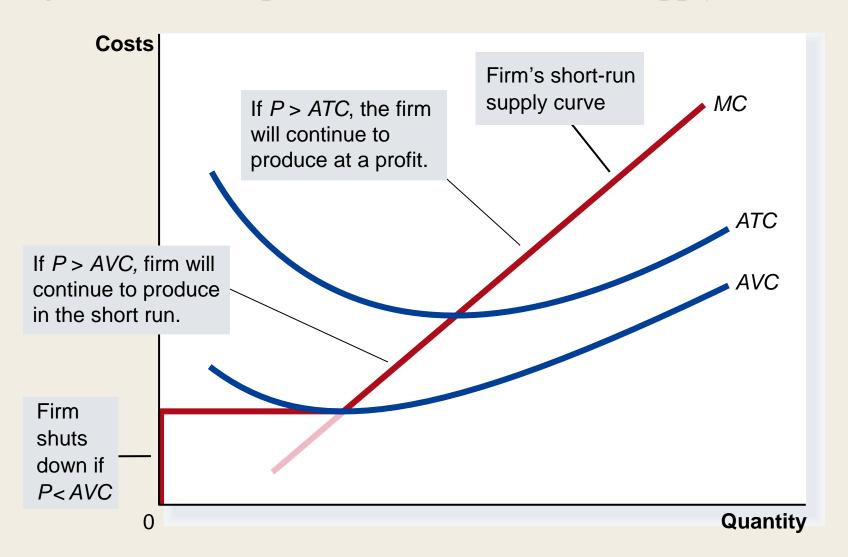

The Firm's Short-Run Decision to Shut Down

- A shutdown refers to a short-run decision not to produce anything during a specific period of time because of current market conditions.
- Exit refers to a long-run decision to leave the market.

The Firm's Short-Run Decision to Shut Down

- The firm shuts down if the revenue it gets from producing is less than the variable cost of production.
 - Shut down if TR < VC
 - Shut down if TR/Q < VC/Q
 - Shut down if P < AVC

Figure 3 The Competitive Firm's Short-Run Supply Curve

The Firm's Short-Run Decision to Shut Down

• The portion of the marginal-cost curve that lies above average variable cost is the competitive firm's short-run supply curve.

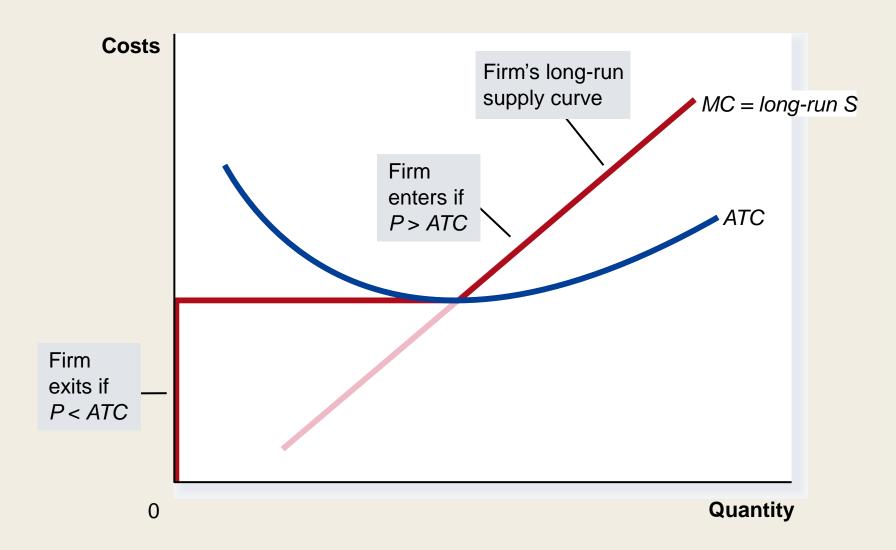

The Firm's Long-Run Decision to Exit or Enter a Market

- In the long run, the firm exits if the revenue it would get from producing is less than its total cost.
 - Exit if TR < TC
 - Exit if TR/Q < TC/Q
 - Exit if P < ATC

The Firm's Long-Run Decision to Exit or Enter a Market

- A firm will enter the industry if such an action would be profitable.
 - Enter if TR > TC
 - Enter if TR/Q > TC/Q
 - Enter if P > ATC

Figure 4 The Competitive Firm's Long-Run Supply Curve

Measuring Profit in Our Graph for the Competitive Firm

- Profit = TR TC
- Profit = $(TR/Q TC/Q) \times Q$
- Profit = $(P ATC) \times Q$

THE SUPPLY CURVE IN A COMPETITIVE MARKET

• The competitive firm's *long-run supply curve* is the portion of its marginal-cost curve that lies above average total cost.

THE SUPPLY CURVE IN A COMPETITIVE MARKET

- Short-Run Supply Curve
 - The portion of its marginal cost curve that lies above average variable cost.
- Long-Run Supply Curve
 - The marginal cost curve above the minimum point of its average total cost curve.

THE SUPPLY CURVE IN A COMPETITIVE MARKET

• Market supply equals the sum of the quantities supplied by the individual firms in the market.

The Short Run: Market Supply with a Fixed Number of Firms

- For any given price, each firm supplies a quantity of output so that its marginal cost equals price.
- The market supply curve reflects the individual firms' marginal cost curves.

Figure 6 Short-Run Market Supply

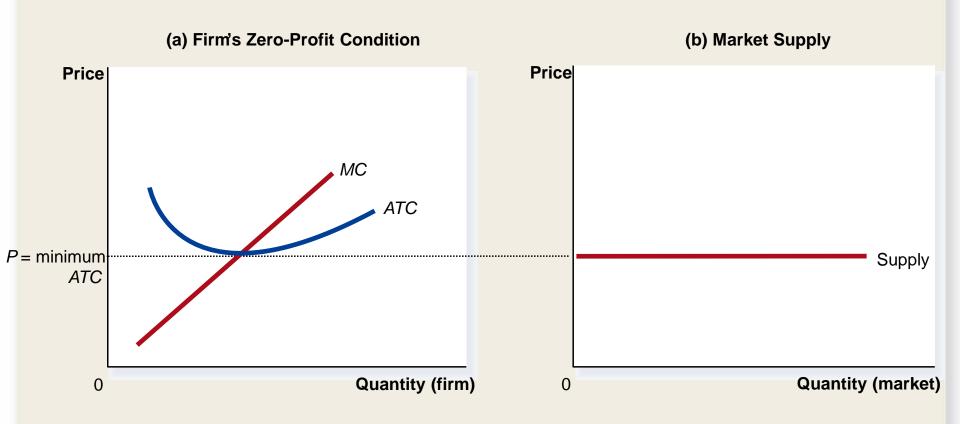

If the industry has 1000 identical firms, then at each market price, industry output will be 1000 times larger than the representative firm's output.

The Long Run: Market Supply with Entry and Exit

- Firms will enter or exit the market until profit is driven to zero.
- In the long run, price equals the minimum of average total cost.
- The long-run market supply curve is horizontal at this price.

Figure 7 Long-Run Market Supply

The Long Run: Market Supply with Entry and Exit

- At the end of the process of entry and exit, firms that remain must be making zero economic profit.
- The process of entry and exit ends only when price and average total cost are driven to equality.
- Long-run equilibrium must have firms operating at their efficient scale.

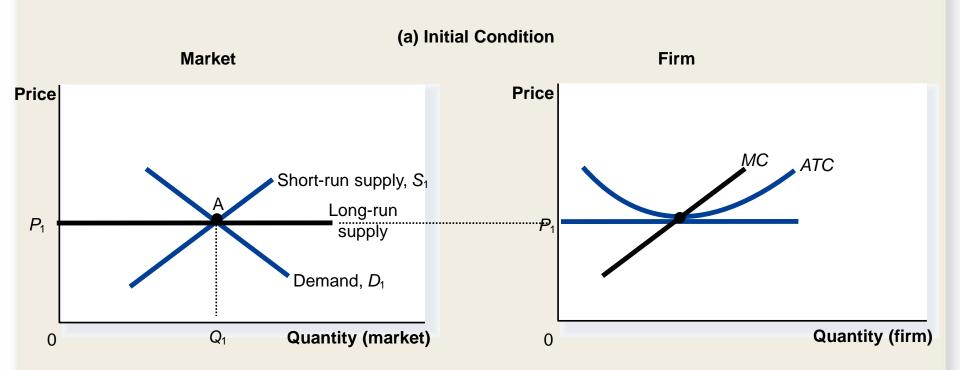

Why Do Competitive Firms Stay in Business If They Make Zero Profit?

- Profit equals total revenue minus total cost.
- Total cost includes all the opportunity costs of the firm.
- In the zero-profit equilibrium, the firm's revenue compensates the owners for the time and money they expend to keep the business going.

A Shift in Demand in the Short Run and Long Run

- An increase in demand raises price and quantity in the short run.
- Firms earn profits because price now exceeds average total cost.

Figure 8 An Increase in Demand in the Short Run and Long Run

A market begins in long run equilibrium.

And firms earn zero profit.

Figure 8 An Increase in Demand in the Short Run and Long

Run

An increase in market demand...

The higher P encourages firms to produce more....and generates short-run profit.

...raises price and output.

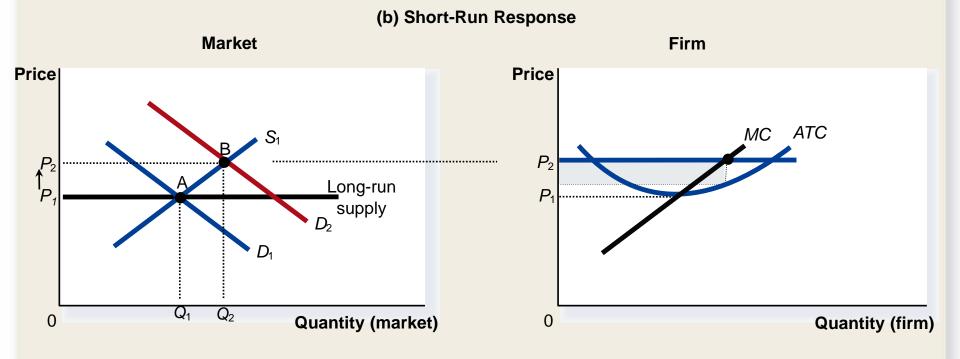

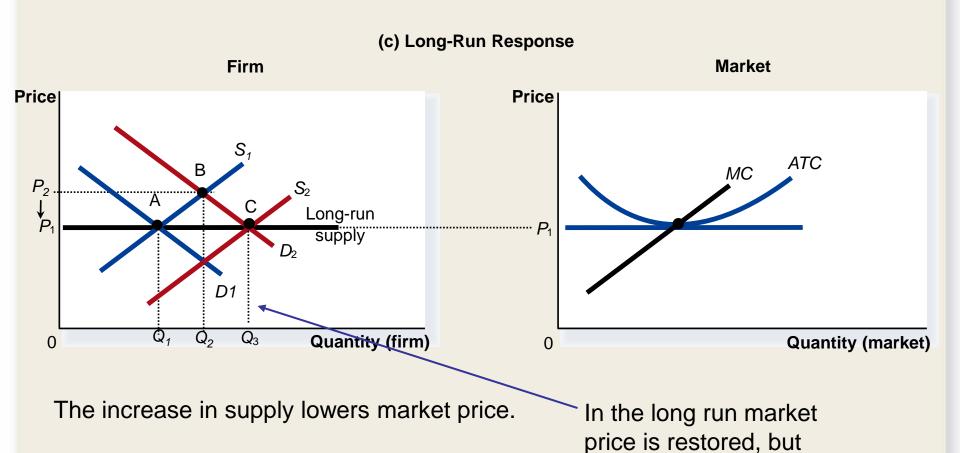

Figure 8 An Increase in Demand in the Short Run and Long Run

Profits induce entry and market supply increases.

market supply is greater.

- Because a competitive firm is a price taker, its revenue is proportional to the amount of output it produces.
- The price of the good equals both the firm's average revenue and its marginal revenue.

- To maximize profit, a firm chooses the quantity of output such that marginal revenue equals marginal cost.
- This is also the quantity at which price equals marginal cost.
- Therefore, the firm's marginal cost curve is its supply curve.

- In the short run, when a firm cannot recover its fixed costs, the firm will choose to shut down temporarily if the price of the good is less than average variable cost.
- In the long run, when the firm can recover both fixed and variable costs, it will choose to exit if the price is less than average total cost.

- In a market with free entry and exit, profits are driven to zero in the long run and all firms produce at the efficient scale.
- Changes in demand have different effects over different time horizons.
- In the long run, the number of firms adjusts to drive the market back to the zero-profit equilibrium.
